ABSTRACT The genomes of 450 members of *Burkholderiaceae*, isolated from clinical and environmental sources, were sequenced and assembled as a resource for genome mining. Genomic analysis of the collection has enabled the identification of multiple metabolites and their biosynthetic gene clusters, including the antibiotics gladiolin, icosalide A, enacyloxin, and cepacin A.

Burkholderia is a diverse genus of bacteria and a rich source of antimicrobial compounds (1). Modern natural product discovery is often guided by genome mining (2) and increasingly relies on large genome collections. Therefore, we have sequenced, assembled, and deposited into public databases a substantial collection of genomes of members of *Burkholderia* and related genera to promote natural product discovery.

Genomic DNA was extracted, using the automated Maxwell 16 instrument with the tissue extraction kit (Promega), from *Burkholderia* strains and strains of related genera that had been grown in tryptic soy broth overnight at 30°C or 37°C. HiSeq 2000 and HiSeq X Ten instruments, with the associated Illumina HiSeq kits for library preparation, generated 125-bp and 150-bp paired-end reads, respectively. Reads were trimmed using Trim Galore v0.4.2 (3), their quality was assessed using FastQC v0.10.1 (4), and overlapping reads were merged using FLASH v1.2.11 (5). The resulting reads were assembled into contigs using the assembler SPAdes v3.9.1 (6). Pilon v1.2125 (7) identified and corrected misassembled contigs, and contigs representing contaminating DNA were identified with Kraken v0.10.5-beta (8) using the MiniKraken database. In addition, four *Burkholderia* strains were sequenced with a Pacific Bioscience RS II instrument using genomic DNA prepared with the SMRTbell template preparation kit v2.0. The sequencing was performed in two runs with P4-C2 and P5-C3 chemistries, and the genomes were assembled with SMRT Analysis v2.3.0 as described previously (9). A quality assessment of the final genome assemblies was performed with QUAST v4.4 (10) (Table 1). Genomic identification was performed by average nucleotide identity (ANI) analyses with fastANI v1.2 (11) and pyani v0.2.9 (ANI using MUMmer [ANIm] to align input sequences) (12), using a $\geq 95\%$ species delineation threshold (11). The NCBI Prokaryotic Genome Annotation Pipeline (PGAP) v4.12 was used for genome annotation (13). Bioinformatics were supported by the Cloud Infrastructure for Microbial Bioinformatics (CLIMB) (14). Default software parameters were used except where otherwise noted.

The genome collection contains 24 named *Burkholderia* species and 17 genomes that possessed an ANI value of $< 95\%$ compared to sequenced type strains. Within the *Burkholderia cepacia* complex, the first representative genome of *Burkholderia arboris*

has been deposited, as well as genomes for type strains of *Burkholderia anthina*, *Burkholderia metallica*, *Burkholderia seminalis*, *Burkholderia territorii*, and *Burkholderia ubonensis*. The collection considerably increases the number of curated *Burkholderia* genomes, specifically for *Burkholderia gladioli* (207 genomes), *Burkholderia ambifaria* (60 genomes), and *Burkholderia vietnamiensis* (35 genomes).

The *Paraburkholderia* genomes cover 14 named species and 1 unnamed species based on ANI analysis. The type strains of *Paraburkholderia caledonica* and *Paraburkholderia tuberum* were sequenced, and the type strains of 11 species were resequenced. Additional genome assemblies were deposited for *Paraburkholderia megapolitana* and *Paraburkholderia phenazinum*. Finally, three *Caballeronia* genomes were identified in the collection, i.e., *Caballeronia glathei*, *Caballeronia zhejiangensis*, and an uncharacterized *Caballeronia* species. The type strains of *Robbsia andropogonis* and *Trinickia caryophylli* were also resequenced.

Multiple novel metabolites have been identified, and their biosynthetic pathways have been elucidated, including the antimycobacterial compound gladiolin (9) and the lipopeptidolide antibiotic icosalides (15) in *B. gladioli*. The discovery and biosynthesis of enacyloxin IIa, an antibiotic with potent activity against *Acinetobacter baumannii* (16–18), and the antioomycete metabolite cepacin (19) have been studied in *B. ambifaria*. Further analysis of this *Burkholderiaceae* genome resource is under way to identify additional biologically active specialized metabolites and their potential applications.

Data availability. The genome sequences in this announcement have been deposited in the European Nucleotide Archive (ENA) under the project accession number [PRJEB35318](https://ena.ebi.ac.uk/ena/record/PRJEB35318). The BioSample accession numbers for the 454 genome assemblies are [ERS4267623](https://www.ncbi.nlm.nih.gov/biosample/ERS4267623) to [ERS4268076](https://www.ncbi.nlm.nih.gov/biosample/ERS4268076). The Illumina paired-end read data associated with these genome assemblies have been deposited under the project accession number [PRJEB9765](https://ena.ebi.ac.uk/ena/record/PRJEB9765), with the exception of *Burkholderia diffusa* LMG 29043, which is available under project accession number [PRJEB35318](https://ena.ebi.ac.uk/ena/record/PRJEB35318).

ACKNOWLEDGMENTS

This study was supported by grants from the Biotechnology and Biological Sciences Research Council (BBSRC) (grants BB/L021692/1 and BB/S007652/1). All analyses were performed using the Medical Research Council (MRC) Cloud Infrastructure for Microbial Bioinformatics (grant MR/L015080/1). A.J.M. acknowledges support from the BBSRC South West Doctoral Training Partnership (grant BB/M009122/1).

We are grateful for the assistance of the Wellcome Sanger Institute core sequencing and informatics groups. We thank John LiPuma (University of Michigan) and collaborators in the International *Burkholderia cepacia* Working Group (<https://ibcwg.org>) for providing bacterial strains used in this study. All bacterial strains in this study are curated in the *Burkholderia* culture collection at Cardiff University.
